Dear Managing Board of PCI Psychology,

I submit the revised preprint "Cross-Cultural Validation and Ideological Fairness of a Historical Perspective Taking Instrument: Evidence from Czech Secondary Students" for evaluation under the Quantitative Psychology and Educational Psychology thematic fields.

The study examines whether a politically charged historical scenario introduces construct-irrelevant variance when students' ideological attitudes align with its content. Using a Czech adaptation of the Hartmann and Hasselhorn Historical Perspective Taking instrument ($N = 293$ students in 10 schools), I examined whether students with stronger right-authoritarian attitudes score higher because the scenario resonates with their beliefs rather than because they reason historically.

The revised manuscript presents qualified evidence rather than a definitive fairness conclusion. No differential item functioning was detected, multi-group fit-index changes were compatible with scalar invariance, and right-authoritarian attitudes were unrelated to the HPT composite after adjustment; historical knowledge was the only consistent predictor. The abstract and Discussion state the limits of this evidence.

The paper also illustrates a staged approach to evaluating whether scenario-based content generates construct-irrelevant variance through attitude congruence. The revision distinguishes preregistered analyses from post-registration measurement analyses, adds uncertainty and reliability estimates, and limits interpretation to the single scenario, item format, sample, and ideological range studied. It also corrects the submitted TOP form, which listed only one deviation from the preregistration: Table S5 now discloses all omitted registered analyses and post-registration additions.

The study was preregistered before data collection (https://osf.io/zsngy). De-identified data, analysis scripts, rendered outputs, and a reproducibility report are available at https://doi.org/10.5281/zenodo.23494026. Third-party instrument files and item text are excluded pending documented redistribution permission; the manuscript and package documentation identify and cite the measures used. A Transparency and Openness Promotion disclosure table is appended to the preprint.

I confirm that this preprint is not published or under consideration for evaluation elsewhere, and I have no financial conflicts of interest related to this article.
