

A. Factor Loadings (Configural MG-CFA)

B. IRT Item Parameters (Multi-Group GRM)

Note. Panel A shows standardised factor loadings (with 95% CIs) from a configural three-factor MG-CFA (WLSMV estimator; Low vs. High ideology tertiles). Panel B plots item discrimination (a) and average location parameters from unconstrained multi-group graded response models. Points near the identity line indicate equivalent item functioning. No items were flagged for DIF after Bonferroni adjustment (familywise alpha = .05; Bonferroni-adjusted p-values).
